One of the most useful classification systems utilizes plant taxonomy. Taxonomy is the science of systematically naming and organizing organisms into similar groups. Plant taxonomy is an old science that uses the gross morphology (physical characteristics, i.e., flower form, leaf shape, fruit form, etc.) of plants to separate them into similar groups. Quite often the characteristics that distinguish the plants become a part of their name. For example, *Quercus alba* is a white oak, named because the underside of the leaf is white.

The science of plant taxonomy is being absorbed into the new science of systematics. The development of more sophisticated microscopes and laboratory chemical analyses has made this new science possible. Systematics is based on the evolutionary similarities of plants such as chemical make-up and reproductive features.

It should be noted that plant taxonomic classification changes with continuing research, so inconsistencies in nomenclature will be found among textbooks. Do not get caught-up in which is correct, as it is moving target. Rather focus on ‘are you communicating’?

An overview of plant taxonomy helps the gardener understand the basis of many cultural practices. For example, fire blight is a disease of the Rose family, therefore it is helpful to recognize members of the Rose family to diagnosis this disease.

**Common Taxonomic Divisions**

The scientific system of classification divides all living things into groups called *taxa* (singular, *taxon*). Plants are in the Kingdom of *Plantae*. Other Kingdoms include *Fungi*, *Protista* (one-celled organisms including yeasts, bacteria, and protozoans), and *Animalia* (animals).
The plant kingdom is divided into two taxa, **bryophytes** (including mosses and liverworts) and **vascular plants** (plants with a vascular system of xylem and phloem).

Vascular plants (sometimes called higher plants) are divided into two subgroups: seedless and seeded. The seeded plants divides into two taxa, **Gymnospermae** (Gymnosperms) and **Angiospermae** (Angiosperms). These make up most of the plants in the landscape.

These taxa divide into **Divisions** (or Phylum). Division names end in ‘phyta’. Examples of phyla include **Ginkgophyta** (Ginkgo), **Pinophyta** (conifers), and **Magnoliophyta** (flowering plants).

**Gymnosperms** (meaning naked seed) do not produce flowers, but rather produce seeds on the end of modified bracts, such as pine cone. Many have scale or needle-like leaves. Arborvitae, junipers, Douglas fir, fir, ginkgo, pine, and spruce are examples of Gymnosperms.

**Angiosperms** (**Magnoliophyta** or broadleaf flowering plants) produce seeds through flowering. Most have broadleaf leaves. Angiosperms are divided into two taxa, **monocotyledon** (monocots) and **dicotyledon** (dicots). Distinguishing between monocots and dicots is a common practice in landscape management. For example, some of our common herbicides work at the monocot/dicot level. Lawn weed sprays (such as 2,4-D and Dicamba) kill dicots (broadleaf plants like dandelions) but not monocots (the grass). Other herbicides will kill monocots but not dicots, allowing the gardener to kill grass (a monocot) in the shrub or flowerbed (dicots).

Additional taxa in descending order include **family**, **genus** and **species**.

**Families**

Families of higher plants are separated from one another by characteristics inherent in their reproductive structures (flowers, fruit, and seed). Many family members share common characteristics in plant appearances, seed location and appearance, and growth habit. However, some families have a lot of diversity in appearance.

Families have primary importance in gardening as they generally share comparable cultural requirements and similar insect and disease problems. Pest management and cultural techniques are often discussed at the family level.

Family names end in ‘aceae’. Examples of common families include the following:

- **Caprifoliaceae** – Honeysuckle family, including Elders, Honeysuckle, Snowberry and Viburnum
- **Fabaceae** – Pea family, including Japanese Pagoda, Locust and Siberian Peashrubs
- **Oleaceae** – Olive family, including Ash, Forsythia, Lilac and Privet
- **Rosaceae** – Rose family, including Apples, Cotoneaster, Crabapples, Potentillas, Peach, Plum, Mountain Ash, and 250 common landscape plants
**Genus and Species**

The taxonomic divisions beyond the family level are the genus and specific epithet names, together called the species. Plants are named using a binomial system. The genus name comes first and is analogous to a person’s last name (like Smith). The specific epithet names follows as a more specific identifier. It would be analogous to a person’s first name (like John).

<table>
<thead>
<tr>
<th>Genus</th>
<th>Specific epithet</th>
</tr>
</thead>
<tbody>
<tr>
<td>Smith</td>
<td>John</td>
</tr>
<tr>
<td>Catalpa</td>
<td>speciosa</td>
</tr>
</tbody>
</table>

**Genera** (plural of genus) are groupings whose members have more characteristics in common with each other than they do with other genera within the same family. Similarity of flowers and fruits is the most widely used feature, although roots, stems, buds, and leaves are also used.

Common names of plants typically apply to genera. For example *Acer* is the genus of maples, *Fraxinus* is the ash, and *Juniperus* is the junipers.

**Specific epithet** generally refers to interbreeding sub-groups of genus or groupings of individual plants that adhere to essential identification characteristics but display sufficient variation so as not to be categorized as replicas of one another. The specific epithet name is always used in conjunction with the genus.

When genus and specific epithet names are written, they should always be underlined or italicized to denote they are Latin words. The genus name is always capitalized, but the specific epithet name is not.

The singular and plural spelling of *species* is the same. In writing, the abbreviation “sp.” following the genus indicates a single unidentified species and “spp.” indicates multiple species. For example, “*Acer* sp.” would indicate an unidentified species of maple, and “*Acer* spp.” refers to multiple species in the maple genus. The “sp.” or “spp.” is not underlined or italicized.

In technical papers, the person who first identified the species, called the **Authority**, follows the specific epithet names. For example, Japanese Maple would be written *Acer palmatum* Thunberg or *Acer palmatum* T. The Irish potato would be written *Solanum tuberosum* Linnaeus or *Solanum tuberosum* L.

Some suggested sources of scientific names include the following:

- USDA Plant Data Base at [http://plants.usda.gov/](http://plants.usda.gov/)
- Manual of Woody Landscape Plants by Dr. Michael Dirr
- Hortus Third or Hortus Fourth

**Variety and Cultivar**

The taxonomic divisions beyond the genus and species level are variety or cultivar. This is an even more specific identifier, similar to a person's middle name.

<table>
<thead>
<tr>
<th>Genus</th>
<th>Species</th>
<th>Cultivar</th>
</tr>
</thead>
<tbody>
<tr>
<td>Smith</td>
<td>John</td>
<td>'David'</td>
</tr>
<tr>
<td>Quercus</td>
<td>rubra</td>
<td>'Aurea'</td>
</tr>
<tr>
<td>Salvia</td>
<td>greggii</td>
<td>'Furman's Red'</td>
</tr>
</tbody>
</table>
**Variety** or **Subspecies** is a sub-grouping of species assigned to individuals displaying unique differences in natural populations. The differences are inheritable and reproduce true-to-type in each generation. For example cauliflower and cabbage are varieties of the same species *Brassica oleracea*.

In technical writing, variety and subspecies names must be denoted with var. or ssp. when following a species name. Names are italicized or underlined, while var. or spp. is not italicized or underlined. For example, the thornless variety of honeylocust would be written *Gleditsia triacanthos var. inermis*. The use of trinomials *Gleditsia triacanthos inermis* is improper usage in scientific nomenclature. The bigfruit evening primrose would be written *Oenothera macrocarpa* ssp. *incana*.

**Cultivar** is a sub-grouping of species assigned to cultivated plants (“cultivated variety”) which display rather unique differences and, when reproduced by seeds or cuttings, retain its distinguishing characteristics. For example, ‘Early Girl’ and ‘Big Boy’ are cultivars of tomatoes.

In technical writing, the cultivar name follows the genus and specific epithet and is always capitalized and written inside single quotes but not italicized or underlined. For example, October Glory Red Maple is *Acer rubrum* ‘October Glory’.

It is possible to have a cultivar of a variety. For example, *Cornus florida* var. *rubra* ‘Cherokee Chief’.

**Strain** is a sub-group of cultivar with specific characteristics, like resistance to a disease or better color. For example, ‘Early Girl VFN’ tomato.

**Clone** is a sub-group of cultivar derived by asexual propagation (i.e., cuttings). The offspring have one parent and therefore are identical to the parent because no exchange of genetic materials has occurred.

**Line** is a sub-group of cultivar propagated by seed.

**Form** is based on selection by growth habit, not reproducible by seed. For example, *Columnar Norway Maple*.

---

**Scientific Names**

Scientific names of plants are Latinized. When Linnaeus published the first books on classification, Latin was used in Western Europe as the language of science. Linnaeus continued this trend using Latin and Greek names.

Latin was the language of **Latium** (an area of ancient Italy) and Ancient Rome. French, Spanish and Italian languages inherit a large part of their vocabulary and grammar from Latin.

Latin is still a part of science, medicine, law, and philosophy. For example, a prescription for a medication may use, “*quater in die*” (Q.I.D.) meaning “four times a day”. “*E Pluribus Unum*”, an early motto of the United States, means “out of many, one”. Today, Latin has the advantage that it provides lingual neutrality between countries and languages.
Pronouncing Scientific Names

Genus and specific epithet names are universal in spelling (that is each plant has a single genus and specific epithet name, spelled the same, worldwide). By using Latin, plants can be positively identified from over 200,000 known plant species.

However, pronunciation of scientific names is not universal, and will vary based on the local language. For example, the tomato may be pronounced ‘toe-may-toe’ or ‘toe-mah-toe’. Based on the native language and local dialect of the user, scientific names may actually sound rather different in various countries.

Many Latin names have become ‘generic’ common names. For example: anemone, rhododendron, crocus, and viburnum.

Here are a few basic guidelines for USA-English:

- Latin was meant to be entirely phonetic. There are no silent letters. What you see is what you say.
- Consonants are pronounced as you normally would. The letters ‘c’ and ‘g’ are normally in front of the vowels ‘a’, ‘o’ and ‘u’. When in front of ‘i’ and ‘e’, the sound becomes soft (‘Cecil’ and “Gentle”).
- The letters “ch” are pronounced like “k”.
- Vowels are long in an accented syllable. For example, *Acer* becomes AY-ser and *Pinus* become PIE-nus.
- There are no silent syllables. For example, *Rudbeckia* becomes rood-BEK-ee-uh and *Miscanthus sinensis* becomes miss-can-thus seye-NEN-sis.
- Where the accent goes, is a matter of local language styles. Here are some suggestions for USA-English.
  - In two syllable words, generally accentuate the first syllable. For example, *Cornus* become KOR-nus.
  - In most other words, accentuate the syllable before the last syllable. For example, *Rhodendron* becomes roo-doe-DEN-dron.
  - If the last syllable contains two vowels, accentuate on the third to last syllable. For example, *Buddelia* becomes BUD-lee-uh and *Campanula* becomes kam-PA-nu-la.
- When pronouncing a name based on a person’s name, try not to change the sound; accentuate on the first part of the name.
- Examples
  - *Quercus macrocarpa* (bur oak) – KWER-kus ma-crow-CAR-pa
  - *Eleagnus angustifolia* (Russian olive) – eel-lee-AG-nus ann-gust-a-FOAL-ee-uh
  - *Ptelea trifoliata* (hoptree/wafer ash) – Tea-LEE-uh try-foal-lee-AH-tuh

Latin Names Add Meaning

Latin names often add meaning about the plant’s description, for example:

- *American* = of America – *Fraxinus americana* (white ash)
- *Baccata* = berry bearing – *Taxus baccata* (common yew)
- *Micro* = little, small – *Antennaria microphylla* (littleleaf pussytoes)
Common Names

On the other hand, common names are often local in use and many times do not clearly identify the specific plant. For example, *Liriodendron tulipfera* is known as the Tulip Tree in the north and as Yellow Poplar in the south. *Carpinus caroliniana* goes by American Hornbeam, Blue Beech, Musclewood, Water Beech, and Ironwood. The European White Lily, *Nymphaea alba*, has 15 English common names, 44 French common names, 105 German common names, and 81 Dutch common names.

Examples of Taxonomic Classification

Vascular plants

Seedless
- Pteridophyta – Ferns

Seeded
- Gymnospermae – Gymnosperms (Naked seed plants)
  - Cycadophyta – Cicads
  - Ginkgophyta – Ginkgo
    - Ginkgoaceae – Ginkgo family
      - Ginkgo biloba – Ginkgo tree
  - Pinophyta – Conifers (cone bearing plants)
    - Cupressaceae (cypress family)
      - Juniperus – Junipers
        - Juniperus horizontalis (Creeping Juniper)
          - Juniperus horizontalis ‘Blue Chip’ (Blue Chip Juniper)
      - Thuja spp. – Arborvitae
    - Pinaceae (pine family)
      - Abies – Fir
      - Larix – Larch
      - Picea – Spruce
        - Picea pungens – Colorado Spruce
          - Picea pungens ‘Bakeri’ – Bakeri Colorado Spruce
      - Pinus – Pines
        - Pinus ponderosa – Ponderosa Pine
      - Pseduotsuga menziesii – Douglas Fir
  - Angiospermae – Angiosperms (broadleaf-flowering plants) / Magnoliophyta
    - Aceraceae – Maple family
      - Acer – Maples
        - Acer platanoides – Norway Maple
          - Acer platanoides ‘Crimson King’ – Crimson King Norway Maple
      - Salicaceae – Willow family
        - Populus – Cottonwood, poplar and aspen
          - Populus deltoids – Eastern Cottonwood
            - Populus deltoids ‘Siouxland’ – Siouxland Eastern Cottonwood
          - Populus tremuloides – Quaking Aspen
    - Rosaceae – Rose family
      - Rosa – Roses
        - Rosa rugosa – Rugosa Rose
          - Rosa rugosa ‘Hansa’ – Hansa Rugosa Rose
      - Cotoneaster – Cotoneasters
        - Cotoneaster apiculatus – Cranberry Cotoneaster
